# ExLibris
## Voyager

**Service Pack No:**

7.1.1

**Highlights:**

This service pack includes eagerly-anticipated WebVoyáge fixes for highlighting, printing records using IE7, location display, simultaneous searching and renewing items when the max global items limit is reached.

It also includes several fixes for staff clients, including a new authority control dll, due date and fines calculations, and deleting MFHDs via bulk import.

**General Documentation for Service Packs:**

| KB Number | Description | Solution | Implementation Notes | Related Documentation | Module | Issue Number |
|---|---|---|---|---|---|---|
| 19331 | In windows 2000 machines, marked line items do not show on the PO when view marked line items is selected either in tools/workflows or the line item dropdown menu. | Fixed Show Components radio button in Workflows/Line Items to retain its value: Selected/Unselected. | | | Acquisitions | 15659 |
| 16384-16113 | An authority record created via the Authority Validation>Create Auth function for a 700 name should be correct whether the user clicks Yes or No when presented with the Authdll32 "Is the full stop at the end of the heading an integral part of the heading." | New authority control dll fixes the problem. | The new AuthorityCreation2007-11.dll version 3.2.0.113 must be installed. Happens automatically with the clients install. | | Cataloging | 16384-6433 |
| 16384-10243 | If the item has been renewed instead of simply charged, the times available for selection when placing a short loan booking include the loan period of the current renewed charge. | Fixed the short loan available time. Items with a status of Charged or Renewed will now show the correct short loan available booking times. | | | Circulation | 16384-4177 |
| 16384-12097 | If a stub record has an expired or not-yet-effective temp or email address, the stub record will attempt to pull a valid temp or email address down from the home record. If the effective dates of the home record's address overlap the dates of the stub's address, the update cannot be completed, and the transaction will fail (a walkup charge gets "A database error occurred while trying to create this patron's stub record;" a WebVoyáge renewal gets a Not Renewed message; placing a request through WebVoyáge gets a "Your patron initiated request failed" message). | Ignore exceptional situations with a stub's e-mail address dates (i.e., expired, not yet effective or overlapping) when performing certain circulation functions such as finding/loading patron in the charge form, charging and/or renewing. | | | Circulation | 16384-4929 |
| 16384-13557 | As a result of previous software bugs, there are entries in the circ_policy_matrix that are not viewable in the client. | A clean up script is provided to remove entries from the circ_policy_matrix table where orphaned patron_group_ids are found (i.e., patron groups that no longer exist in the patron group table). Only those entries that are not linked to any circ transactions will be removed. After the script is run, the user will be able to delete the dummy item types which are the product of the fix to issue 19172 in SP 7.0.2. | | | Circulation | 16384-5298 |
| 16384-15729 | If one of the requests attached to an item is expired by circjob 6 (Request Expired/Cancelled Notices), subsequent requests may be given an incorrect rank and the count in ITEM.holds_placed/recalls_placed may be incorrect. | Fixed circjob 12. When Holds/Recalls expire, subsequent Holds/Recalls are now ranked correctly. | The script (004.sql.2007.1.1.BETA01) needs to be run to FIX the item counts and the queue positions for holds and /or recalls that were set incorrectly before this bug was fixed. | | Circulation | 16384-6146 |
| 16384-15906 | Hourly loan intervals are calculated incorrectly when charged out between 12am-5am. | Resolved by fix to 16384-2193. | | | Circulation | 16384-6193 |
| 16384-15907 | When the matrix is set to have a loan interval of 24 hours, the loan period calculated is only the amount of time the library is closed. | Resolved by fix to 16384-2193. | | | Circulation | 16384-6194 |
| 16384-5235 | Short Loan items are due at library closing time when they should be due next day. | Resolved by fix to 16384-2193. | | | Circulation | 19303 |
| 19892 | Fines are assessed for closed hours when they are due after midnight, even if Count Closed Days/Hours/Minutes for Fine is unchecked. | Fixed the fines assesed for items due after midnight when "Count Closed Days/Hours/Minutes for Fine" is un-checked in Sysadmin. | | | Circulation | 19308 |
| 16384-1828 | Before midnight, time is applied correctly. After midnight, due time is library closing time that same night. Workflow implications: Can't check out items for overnight loan after midnight. | Resolved by fix to 16384-2193. | | | Circulation | 16927 |
| 16384-6564 | All search terms are highlighted, including "and," "or," and so on. If the noiseword filter is enabled, noisewords will be highlighted even if they weren't searched for. | Search term cross check against stop words is now done on a case insensitive basis. | | | OPAC | 16384-2514 |
| 16384-6563 | Portions of words in the results are highlighted if they match the search terms, even if they are not the complete word that retrieved the result. | Modified the code to only allow plural logic if the preceding character before the search term is nonalphanumeric. | | | OPAC | 16384-2515 |
| 16384-6562 | After conducting a phrase search, each keyword in the results and record display pages is highlighted individually, even if it's not part of the phrase that retrieved the results. | Rework of a customer-developed, re-implementation of the ExLibris highlight.js. | | | OPAC | 16384-2516 |
| 16384-9298 | Records printed in IE7 using the print function from either the record page or the titles list prints one word to a line; this layout on the page differs from that on the screen. | Works correctly in 7.1.1. Was fixed by the modifications made to support FF3 in 7.1.0. | | | OPAC | 16384-3633 |
| 16384-8323 | Results from search terms including an ampersand or the above initials show every instance of "&nbsp" with one or more letters highlighted. | Rework of a customer developed re-implementation of the ExLibris highlight.js | | | OPAC | 16384-3169 |
| 16384-14948 | When conducting a Simulsearch that includes a remote database (Voyager to Voyager) and local database, the produced results include holdings information for both local and remote databases. Holdings information for remote database is no longer available in the titles list. | An unnecessary check for DB_KEY, prevented the retrieval of holdings information for non-UB databases. Corrected faulty logic to display the "No Holdings Available" message only when that is the case and the count returned is 0. | | | OPAC | 16384-5793 |
| 16384-10578 | If two or more items have matching permanent locations that differ from the MFHD location, the MFHD location displays in WebVoyáge. | Added code to support using the location of the item if all items share the same permanent location, have no temporary locations, and the permanent location differs from the holding location. | | | OPAC | 16384-4209 |
| 16384-11890 | If the title is very long (more than 499 characters long), you are not able to search using a left-anchored title index successfully without including the non-filing characters. | Corrected the length of the title display buffer to be correct for all title lengths. | | | OPAC | 16384-4772 |
| 16384-18194 | When running an SimulSearch from the Advanced Search page, only results from the local database are returned. | Added Simulsearch flag and value to the boolenSearchHandler to enable Simulsearch from the Advanced tab. | | | OPAC | 16384-7218 |
| 19833 | Numerous problems have been found throughout searching in WebVoyáge which cause found records not to have the search terms bolded and italicized on the records' displayN.cfgs. Causes of this problem include (1) any search from the Simple Search page (minus the hard-coded searches such as FT* and CMD), (2) search terms that include diacritics (records found without using the diacritic), (3) the search term contains multiple words, and (4) the search is a keyword headings search. | Rework of a customer-developed, re-implementation of the ExLibris highlight.js. | | | OPAC | 19038 |
| 16384-18849 | The SRU response sent by the Voyager SRU server is not UTF-8 encoded / labeled as UTF-8 encoded. | Added the backendcharset = "utf-8" to srusrwsvr.xml script to send data in utf-8 format. | The z3950svr.ini file, located in the xxxdb/ini directory, needs to have its encoding set to UTF8. By default, it is set to MARC8. | | General (Voyager) | 16384-5699 |
| 16384-15793 | Extracted bib records with diacritics in the MFHD are losing those diacritics when the 949 "availability" field is created. | Changed the call number data in byte format before converting to a string in UTF-8 encoding to display the diacritics properly in the 949 "availability" filed. | | | Interoperability (Voy) | 16384-6161 |
| 16384-8881 | Users are unable to renew in WebVoyáge when Max Global items is set for patron group. | Added logic to allow renew via override method if the initial block was patron charged item limit. | | | OPAC | 16384-3457 |
| 16384-13556 | When deleting MFHDs via Bulk Import, the deleted MFHDs are deleted from the system and are not available in the deleted.mfhd.marc file in the /rpt directory. | Added the MARC MFHD extract processing of bulkimport's delete.imp.YYYYMMDD.HHMM files which may contain MFHDs deleted during the bulkimport process. | PrimoExp.ini has a new entry: DelMFHDsImpFile=delete.imp | | Batch jobs | 16384-5297 |
