

ExLibris Voyager

Release:

7.2.4

Highlights:

This release contains bug fixes for various staff modules and WebVoyáge.

General documentation for this release:

<http://docs.exlibrisgroup.com/docportal/>

KB Number	Description	Solution	Implementation Notes	Related Documentation	Module	Issue Number
19287	The call number must include spaces when there is a double cutter (when the second cutter is separated by an indicator).	Call numbers with double cutters must be searched without a space between the cutters.	Regen required (MFHDINDEX = Y) to refresh the currently stored call numbers so that they can be searched with the new rule outlined in the solution.		Cataloging	15058
19309	Approving a purchase order and selecting check for duplicates, returns line items with their purchase order numbers as a mixture of the po_number and po_id fields from the database tables.	Send back to the client the purchase order number field when the check duplicate order API is called and consistently use that number in the client when displaying the list of duplicates.			Acquisitions	15377
16384-3031	You need to hit the Tab key twice if you are on the History tab to find the cursor.	The code was modified to set the focus to and highlight the first row on the list of updates on the History tab.			Cataloging	15495
19347	All drop-down lists on the Approved/Sent Purchase Order seem to be active, but the customer cannot choose from the Site, the Bill To, or the Line Item Type drop-down lists in Line Item Details in order to change items on an Approved Purchase Order. The customer can change PO Type and Ship To but not Account, Bill To, or Line Item Type.	The code was modified to disable the drop-down lists that could not be accessed.			Acquisitions	15879
19366	Attempting to cancel a purchase order totaling an amount greater than 0 with line items attached to an expired fund, results in a "run time error 91 Object variable or With block variable not set" message and a shutdown of the client.	In case a fund related error occurs during the cancelation process of an approved purchase order, the client displays the actual error in a separate form. This form needed to know who its parent form was or a run time error would occur. <u>This is what has been corrected.</u>			Acquisitions	16307
16384-27555	When changing a subject heading subfield, it creates a duplicate entry in the Headings List for the subdivision.	Changing a subject heading subfield in a bibliographic or authority record no longer creates a new subject heading in Staff Subject Subdivision searching.	Run a regen with HEADINGS=Y. The headings_subdivision table has extra entries which are cleared by running a regen on headings. The problem is not made worse if a regen is not done. The expected result is not seen unless the regen is performed.		Cataloging	16883
16384-3307	Issues that you checked in on the purchase order, prior to copying the purchase order with components relinked, cannot have item records added via serials.	A purchase order copy updates the issues received with the copy ID associated with the new purchase order and linked components.			Acquisitions	17361
19290	When doing a Global Headings Change, Pcatjob 13 does not change the 1xx if there is a 240 tag present in the bibliographic record even though the catjob.log says it is processed.	Pcatjob 13 changes a 1xx in a bibliographic record even if there is a 240 tag present in the bibliographic record.			Cataloging	17439
19508	The system does not prevent you from importing an incomplete 007. You are also unable to edit or delete an incomplete 007 field. When you click to try to delete the 007, you receive the "Run Time Error 9: Subscript out of range" message and the Cataloging client dies.	An invalid 006 or 007 (that is, one where the form or category of material is blank), is not displayed. It cannot be displayed and is deleted when the record is saved. An informational message displays when you open a record with such a field. This condition is assumed to be rare.			Cataloging	17830
19557	When entering amounts over \$999.99 in Max Fine Amount and Max Fine for Recalls, the system does not properly save the dollar amount entered if it is above \$999.99 and below the allotted \$9999.99.	The code was modified to remove the comma from the dollar amount when saving the data to allow for the correct saving of amounts between \$999.00 and \$9999.99.			System Administration	18045
16384-3530	Even if patron group rules are set on the Patron tab in SysAdmin>Circulation>Policy Definition for the OPAC Circ Desk, placing a Title Level Recall does not correctly populate the patron group ID in the hold/recall table.	The patron_group_id field of the Hold_Recall table is populated when a recall is made from the Tomcat WebVoyage Recall Request screen.			Reporter	18351
19704	When you have exactly 682 issues checked in, the receipt history does not display (you see the standard "No receipt history" message), but the data remains in the issues_received table.	The logic flaw that caused the problem of the disappearing history which occurred at 682 and any multiple of 682 issues received has been fixed.			Acquisitions	18593
19690	z39.50 connections are logging erroneous and incorrect error messages. This leads customers to investigate problems with connections that do not exist. It also causes logs to grow excessively quickly filling up file systems for sites that have extensive z39.50 activity.	Downgraded several z39.50 log messages from Error to Warn or Debug. Messages included those for Z39.50 INIT, Z39.50 CLOSE and session timeout.			Z39.50 Server	18709
16384-26131	Circjob 43 does not clear orphaned entries in UB_PATRON_RECORD.	Circjob 43 clears orphaned entries in the UB_PATRON_RECORD which allows patron records to be deleted through circulation.			Circulation	16384-10113
16384-28049	VPDS returns <xml-fragment> when given invalid input.	The code was modified to return an error message when provided input that is invalid.	Both VoyagerLib-VoyagerPDSSchema-v7.2.4.jar & Voyager-PDS-v7.2.4.jar must be deployed.		Batch jobs	16384-10274

KB Number	Description	Solution	Implementation Notes	Related Documentation	Module	Issue Number
16384-26834	User unable to import an Authority record via Cataloging or Bulkimport that has 5xx tags (such as 510).	The code will no longer attempt to insert duplicate authority headings into the heading table.			Batch jobs	16384-10481
16384-30593	If there are no active Course Reserve lists to display in the OPAC, users are taken to the same page that they were originally on when clicking on the Course Reserve tab. No message is displayed that there are no active reserve lists.	The code was modified to remain on the Course Reserve page and display a message when there are no active course reserve lists to display on the Course Reserve tab.			OPAC	16384-10545
16384-27939	Searching ignores punctuation.	Punctuation normalization is now limited to keyword searches. Parentheses normalization has been corrected to allow for OCLC numbers.			OPAC	16384-10642
16384-27953	A search built with multiple search terms joined by AND fail if the word order is not used first.	The boolean keyword searching, on the advanced search page, for search terms that begin with AND or OR was fixed.			OPAC	16384-10705
16384-28675	Multi-piece items do not trigger an alert.	The code was modified to set the unique block code so that the alert is invoked when the multi-piece alert is set to Y.			Circulation	16384-10977
16384-34626	Typically when the extract runs into problem records, it aborts completely without useful messages and does not process the rest of the records for that run.	Vprimo extract logs errors and skips to the next bibliographic record when it encounters bad bibliographic data.			Interoperability (Voyager)	16384-11009
16384-28882	The Record Holdings XML service is returning the copy number in the item status attribute rather than giving it its own unique attribute under this element.	The display of the copy number can now be toggled in the Record Holdings XML service.			Interoperability (Voyager)	16384-11057
16384-29058	Attempting to load the Set Limits page in the Classic OPAC under Linux causes the user's session to die.	The limits page can now be accessed for Classic OPAC on the Linux platform.			OPAC	16384-11121
16384-29329	If you are using OPAC via Primo and have the SysAdmin>OPAC configuration>Miscellaneous>Call Slip Item Required checked, the request form initially displays without a copy selected. If you submit the form this way, the request is accepted and becomes an itemless call slip.	The code was modified to not send the no-item element when the Call Slip Item Required is selected in Voyager System Administration.			Interoperability (Voyager)	16384-11249
16384-29713	Catjob 11 is not clearing certain headings from the queue.	The Catjob clears headings that cannot be processed from the queue tables when it finds them during Catjob 13.			Cataloging	16384-11297
16384-29604	When a new note is added to the patron record, the counter does not increase.	Allow the patron form to refresh after a patron note is added or removed. The counters will be updated.			Circulation	16384-11345
16384-29601	If your database is on a Linux server and you attempt to access message data for invoices/purchase orders loaded before your migration to the Linux platform, the Message: EDIFACT view displays but all lines display as blank and scroll continuously which prevents the operator from doing anything else in Acquisitions.	A batch job was created to convert the EDI message data created on Solaris prior to the customer's Linux database creation to the Linux format. This job is to be run by Ex Libris staff for the customer.			Acquisitions	16384-11377
16384-29890	Across clients, staff entering passwords longer than the 9-character limit is handled differently.	The entry of a password has been limited to 9 characters instead of 10. All applications should now only accept 9 characters and validate against 9 only.			System Administration	16384-11441
16384-34627	The patron places a hold request using third-party system (such as Relais) and needs to be able to specify a pickup location for the item. Current functionality provides for a single default pickup location as specified in the library's configuration file (intercirc-ursa.ini).	The code was modified to use the To Agency ID field in the Accept Item and Request Item messages to supply the pickup location. The solution requires a change to the intercirc-ursa.ini file. Please see the implementation notes.	The fix will not be visible without change to the intercirc-ursa.ini file as per the following: Added the following flag under [Borrowing] stanza, if set equal to "N", will cause to use the pickup location from the To Agency ID field. Otherwise the default pickup location will be used from the Borrowing stanza in intercirc-ursa.ini file. UseDefaultPickupLocation=Y Added the following flag under [Lending] stanza, if set equal to "N", will cause to use the pickup location from the To Agency ID field. Otherwise the default pickup location will be used from the Lending stanza in intercirc-ursa.ini file. UseDefaultPickupLocation=Y		General (Voyager InterCirc U.2)	16384-11537

KB Number	Description	Solution	Implementation Notes	Related Documentation	Module	Issue Number
16384-34628	When VXWS and VWEBV are started simultaneously, VXWS is not initialized in time for VWEBV to initialize correctly. The same problem is observed when VXWS is started after VWEBV is started. Currently, the VWEBV Tomcat checks one time to connect. If it does not connect successfully, it populates with default values that disables Universal Borrowing in the OPAC.	VWEBV now polls VXWS using a configurable timeout that is set in web.xml in order to be able to retrieve service data in cases where VXWS has not yet started.	The VWEBV web.xml has been updated. The following has been added: 1) context parameters for a timeout, 2) filter mapping for VoyConfig, 3) an error page for HTTP 503 status, and 4) a new error_503.html.		OPAC	16384-11601
16384-30353	A patron suspended in its home database is not blocked from charging out an item in the stub database.	If a patron is suspended at the home database and attempts to charge at a remote location as a stub, the operator is notified of the suspension block at the home database and has the ability to override the situation (based on permissions).			Circulation	16384-11633
16384-30354	When a fine has been partially posted against, the fine/fee information that displays as part of the 64 message from Voyager includes postings against existing fines but not the amount.	The code was modified to include the correct amount when the postings have been made against a fine.			General (Voyager Self Check V2.0)	16384-11697
16384-30659	The BE field in the 64 Patron Information Response message is blank.	The Patron Information Response message has been corrected to include the patron's e-mail address in the BE field.			General (Voyager Self Check V2.0)	16384-11841
16384-31314	Fines/fees paid using SIP2 are only accepted if the patron's barcode is active.	The code was modified to allow the processing of fines/fees for patrons with an inactive barcode.			General (Voyager)	16384-12049
16384-31317	When placing a recall request within a request group, recall requests made in WebVoyage seem to place a recall request on one item not necessarily in the request group and holds on all other items regardless of the request group.	Retrieve the request group ID from the recall request and send the request group to the OPAC server for hold/recall processing.			OPAC	16384-12082
16384-32209	When the user attempts to relink a purchase order line item to an EDI invoice, he gets "Run-time error '91': Object variable or With block variable not set" and the Acquisitions client then closes.	Purchase order line items can now be relinked to EDI invoices.			Acquisitions	16384-12497
16384-32241	If the callslipsvr process launched at the pickup database dies off when processing a request in Call Slip in the holding database, any subsequent requests processed for that database cannot connect back to the pickup database; and the necessary rows do not get created in hold_recall. On the holding side, the rows that get written to ub_hold all have the hold_recall_id of the last request that successfully was successfully processed.	The solution is to prevent Call Slip from processing requests if the Call Slip server process that was launched at a remote database goes away for any reason.			General (Voyager Universal Borrowing)	16384-12529
16384-33524	The MARC21 tag tables include fields 380-384 in the Bmarc3xx.cfg but do not include fields 380-384 in the master.cfg. As a result, those fields cannot be validated in Cataloging.	The MARC21 master.cfg was updated with the missing 38x fields.	Install or merge the new master.cfg file.		Cataloging	16384-13009
16384-6101	When retrieving a 1xx authority record in WebVoyage via WebAuthorities, if the 1xx heading has more than 255 characters, the Heading Type column displays characters 256 and one of the 1xx fields.	The size of the heading buffer was increased so that it does not overwrite the type field.			OPAC	16384-2370
16384-7297	If you accidentally select the same fund twice when splitting an allocation across two or more funds and then save the copy information and the line item details, you get a run time error 457 and the client closes.	The code was modified to prevent adding the same fund twice on one line item.			Acquisitions	16384-2723
16384-12035	When running Catjob 13 with no entries marked to process, the job dies; and on some servers, a core file is produced.	This is working correctly in 7.2.4.			Cataloging	16384-4865
16384-14584	The Search tab in WebVoyage brings up the Basic Search page. This cannot be changed.	Two properties were added to webvoyage.properties so that a starting search tab may be defined. The new properties can be used to set the header and footer starting search tab. The default is still the Basic Search for header and footer if the new properties are not defined.	Two new webvoyage.property properties have been added to webvoyage.properties. No configuration changes need to be made if changing the starting search tab is not desired. First, the new property for the page header is as follows: page.header.buttons.search.start=The Ex Libris possible values are searchSubject, searchAdvanced, searchAuthor and enterCourseReserve.do. Other values may be valid if you have defined your own search tabs. Second, the new property for the page footer is as follows: page.footer.buttons.search.start=See above for the valid values. The default webvoyage.properties comes with no values defined so the default remains searchBasic.		OPAC	16384-5617

KB Number	Description	Solution	Implementation Notes	Related Documentation	Module	Issue Number
16384-27557	When creating an authority for a certain heading type, the created record defaults incorrectly to a subfield a. For example, in a bibliographic record: 100 = 100 1_ \$a Peyrefitte, Alain, \$d 1925-1999. and 240 = 240 10 \$a Quand la Chine s'éveillera ...le monde tremblera. \$l English. The authority heading created from the authority validation screen is: \$a Peyrefitte, Alain, \$a Quand la Chine s'éveillera ...le monde tremblera. \$d 1925-1999. \$l English. This is incorrect. The correct form is: \$a Peyrefitte, Alain \$d 1925-1999. \$t Quand la Chine s'éveillera ...le monde tremblera. \$l English.	When creating an authority record for a 100/240 heading, the second \$a (from the 240) is changed to a \$t.	The client install must install the new AuthorityCreation2007-24.dll version 3.2.0.133.		Cataloging	16384-8177
16384-21522	The extract uses the reserve_item_history.effect_date value to compare against the ChangedSince date. However, this column only updates when an item is first flagged as On Reserve not when an item already on reserve is added to a new course reserve list.	When an item is added to a reserve list and it is already on reserve, update the effect_date in the reserve_item_history table. This triggers an update to the bibliographic record for Vprimo extract.			Interoperability (Voyager)	16384-8897
16384-21537	When running acqjob 4 independent of the fiscal period close, the job sometimes pulls in rollover status information from very old ledgers and not from the ledger specified based on the date parameter.	The Rollover Status Report job now uses the supplied rollover date when processing the report.			Acquisitions	16384-8913
16384-22465	If a MFHD does not have a call number in the 852 field but is associated with a bibliographic record that also has another MFHD that has a call number and a lower MFHD ID, both pull the call number from the lower mfhd_id into the 949 subfield d when the MFHDs are extracted.	Call number will not appear in the extract if the MFHD does not have a call number.			Interoperability (Voyager)	16384-9234
16384-22641	MFHDs are not deleted via Bulkimport using the -r parameter. The import log shows "No MFHDs to delete."	The 852B code is reserved for duplicate detection in MFHD-Replace. The System Administration module does not allow the user to enter the code 852B for the Holdings Keyword Definition or Keyword Definition. An error message alerts the user.	A cleanup script is required to change a search code of 852B that may be associated with a Keyword or MFHD Keyword Search. The code is changed to the next available code. This is typically the 852C unless that code is in use. If it is in use, then another unique code is found.		Batch jobs	16384-9267
16384-23169	If the 008 is not present in the record, one cannot Replace or Merge (or delete with Bulkimport using the -x parameter) bibliographic records via Bulkimport or the Import function in Acquisitions.	Complete Replace or Merge in Bulkimport and the Import function in Acquisitions if the 008 is not present in the bibliographic record.			Batch jobs	16384-9409
16384-24353	If a course reserve list has e-items attached to it, the reserve list can be deleted and no error message is produced. The e-items are now orphaned, and any MFHDs attached to the e-items cannot be deleted via the Cataloging client.	The code was modified to prevent deletion of the course reserve list when there are e-items attached to it.			Circulation	16384-9762
