ExLibris
Voyager

Release:
7.2.5

Highlights:

This release contains bug fixes for various staff modules and WebVoyáge.

General documentation for this release:

http://www.customercenter.exlibrisgroup.com/

KB Number	Issue Number	Description	Solution	Implementation Notes	Related Documentation	Module	Issue Number
19278	14626	Search redirects that use the title attribute in the XML files will fail if the redirect field contains a quotation mark.	Remove the quotation marks from the titles that are used for search redirection.	Changes were made to the *display.xsl* file.		OPAC	14626
16384-37441	14784	For collapse issues from bimonthly months, the OPAC display is incorrect.	Display bimonthly collapsed issues with the months represented with bimonthly values.	Changes were made to the *104x_display.xsl* and *104x_chronValues.xml* files.		OPAC	14784
19323	15569	When a patron makes a short loan request and then requests the next available time slot too, it appears to accept both requests but actually ignores one of the requests and displays in the patron record as available.	Modified the logic to allow patrons to make back-to-back, short-loan requests.			OPAC	15569
16384-3156	15955	Post upgrade to 2001.1.1, the item types in Course Reserves no longer sorts. The item types in Cataloging seem to be sorting correctly.	The Item Type dropdown is now sorted in Acquisitions (subscription maintenance) and Circulation (create/add bib/item for a reserve list).			Circulation	15955
16384-3490	16693	On the My Account page, when viewing information about fines and fees, the All Patron Groups label that appears cannot be modified.	Added a new property to handle the display of the All Patron Groups label on the My Account page.	Changes were made to the *weboyage.properties* file.		OPAC	16693
19397	16991	Items that are on a course reserve active and expired list show up twice. The list's effective dates are ignored.	Modified the code to exclude the display of items on inactive course reserves.			OPAC	16991
16384-2976	17027	The information that appears in the vendor accounts dropdown is pulled from the vendor account name field. If you did not assign an account name for a particular account (it is not a required field), you will see blank lines in the dropdown.	Part 1: Make the account name on the vendor account a required field. Part 2: Populate empty account names in the vendor account records in the database with a default value. The default value is the account number which has always been a required field.	An SQL script needs to be run to populate the empty account names.		Acquisitions	17027
19531	18049	There seems to be a limit on the characters that can be entered in the Search For field in Serials Check-in Search.	When searching for a serials check-in title, the search results include titles that are truncated at 45 characters if the search argument is longer than 45 up to the limit of 100. The old length for component titles prior to version 5.0 was 45 and the component names that had been entered prior to the change, are still truncated at 45 in the database. This allows their retrieval.			Acquisitions	18049
19639	18301	All redirect searches fail if the argument contains a pound sign.	Redirect searches on arguments with a pound sign succeed after the pound sign is converted to a URL encoded value.	Changes were made to the *display.xsl* file.		OPAC	18301
19772	18848	The 3000 code does not work for e-mails sent by the OPAC.	Add the skin changes for processing the 3000 code in e-mail sent by Tomcat WebVoyáge.	Added xsl code for the formatting of the 3000 code for emailed MARC Bib and MFHD data. The changes are all in *display_text.xsl*. If the changes are not added then the 856 link information is not displayed in e-mails from Tomcat WebVoyáge.		OPAC	18848
16384-15444	33204	Relevance sorting is not available for the Advanced Searches in the Tomcat version of WebVoyáge. There is no variable that can be configured that's equivalent to Boolean relevance in the [Search Dialog] stanza of the *opac.ini* file.	Added a new property to handle the display of relevance sort for the Advanced searches.	Changes were made to the *weboyage.properties* file.		OPAC	33204
16384-27938	16384-10641	Operators get *Run-time error '381': Invalid property array index* when clicking in the empty Item Statistical category box.	One can safely click in the statistical categories list even when empty.			Cataloging	16384-10641
16384-29490	16384-11281	The Borrowing Blocks displayed on the My Account page do not properly replace the substitution tokens.	Corrected the substitution tokens for the Borrowing Block messages on My Account page.			OPAC	16384-11281
16384-30833	16384-11937	Alt text for the links in the Action Box always displays as Action Navigation.	Modified the code to handle the tooltip text for the links in the Action Box.	Changes were made to the *displayFacets.xsl* and *webvoyage.properties* files.		OPAC	16384-11937
16384-31460	16384-12177	The 64 response (to the 63) can only return the first 20 records charged to a patron.	Modified the code to return all charged items to a patron in the 64 response message.			General (Voy Self Check V2.0)	16384-12177
16384-32065	16384-12465	If a patron's fine was reduced by a method other than Payment (Error, Forgive), Voyager doesn't send OvP an accurate balance or details about the amount or method of posting.	Modified the code to include the details for the posting type of Forgive and Error.			Interoperability (Voy)	16384-12465
16384-33425	16384-12817	Using \\u or \\t to add the due time to the itemStatus field adds a time of 00:00.	One can now add the due time to the itemStatus field in the Item Resource API.			Interoperability (Voy)	16384-12817

KB Number	Issue Number	Description	Solution	Implementation Notes	Related Documentation	Module	Issue Number
16384-37442	16384-14082	Issue 16384-8834: There is no Reset button on the basic, advanced, subject and author search pages. The fix for this issue was to add a Reset button for other search tabs consistent with the positioning in the Course Reserves tab. However, this means the Reset button is now where the Search button was in previous releases.	The buttons in the *searchFacets.xsl* file are, by default, displayed with the Search button first, then the Reset button. This is a tweak to the fix for issue 16384-8834 which added a Reset button to the search pages but placed it where the Search button was which caused work flow issues for patrons used to hitting the search button at a specific location on the screen.	Changes were made to the *searchFacets.xsl* file.		OPAC	16384-14082
16384-30641	16384-3585	Including reserved characters (such as &) in location limit group names makes the limit not work when selected from the post-search filter list.	In filtered searching with location limit groups (LOCA), reserved URL characters are converted so that the filtered search is executed correctly.			OPAC	16384-3585
16384-10195	16384-4065	Changing the appropriate variables in *webvoyage.properties* has no effect.	Modified the code to handle the custom texts that display in either the link in the *Your Items* box or the section labels on the My Account page.			OPAC	16384-4065
16384-10965	16384-4385	Request forms do not display the title being requested.	Modified the code to display a bibliographic records title on the request forms.			OPAC	16384-4385
16384-12065	16384-4897	If a bibliographic record is attached to a serials check-in component and the component's selected Default Item Type on the *Subscription Maintenance>Component Details* tab does not have a defined Display Name in *SysAdmin>System>Item Types*, a search for the bibliographic record in the Tomcat WebVoyáge will return a *No holdings available -- check at the Circulation Desk* message even if no issues are checked in and no item records are attached.	Changed the OPAC server so that if the Item Type does not have a Display Name, the bibliographic record attached to the subscription component displays in WebVoyáge.			OPAC	16384-4897
16384-13953	16384-5425	Z39.50 is displaying call numbers with a semicolon in the middle of it.	The semicolon was removed between the parts of the call number (subfields h and i).			General (Voyager)	16384-5425
16384-15443	16384-5937	When applying post-search filters to a search with essentially marked terms (that is, keywords preceded by a plus sign), any marks are removed.	Marked terms retain their markings when the search is performed with a filter.			OPAC	16384-5937
16384-18017	16384-6961	After enabling Syndetics Cover Images, for records with bibliographic information that spans multiple MARC fields, the first row displays properly. However, all subsequent rows are more left-justified than expected.	Modified the code in a css file to wrap all subsequent rows after enabling Syndetics cover Images on the holdings page.	Changes were made to the *ieFixes.css* file.		OPAC	16384-6961
16384-18018	16384-6993	There is no record separator when exporting multiple records in the EndNote format.	Modified the code in an xsl file to include equal symbols between each record when exporting in EndNote format.	Changes were made to the *endNoteCitation.xsl* file.		OPAC	16384-6993
16384-18242	16384-7091	E-mails sent from the OPAC for records with multiple instances of a given MARC field are not always printing perfectly. Particularly, the second and later instances will not line up properly.	This problem was fixed in 7.2.3.			OPAC	16384-7091
16384-18250	16384-7265	When using Insert URL from the browser (Ctrl+U), Voyager only pulls URLs from IE browsers. If Firefox is the only browser running and Ctrl+U is tried, the user receives the error message *Web Browser needs to be running*.	Added code to the Cataloging client to support the Insert URL from the Browser function (Ctrl+U).			Cataloging	16384-7265
16384-18882	16384-7521	Running a quick search with no results sends users to the Advanced Search screen with the error *Search returned no hits*, but no information entered into the form fields.	Changed the context parameter for QUICK search to the SearchBasicServlet page.			OPAC	16384-7521
16384-18883	16384-7585	When browsing through a list of records via the Next/Prev links while viewing a record in a newly created record view, the next page displays in staff view mode by default.	The Next/Prev links in the record view will maintain the current view when browsing from the record page.			OPAC	16384-7585
16384-18899	16384-7713	If you set *page.myAccount.chargedItem.renew.all=N* in *webvoyage.properties*, Select All is removed but the check box is not.	Modified the code in an xsl file to not display the check box for Select All on the My Account page when the Renew All property for charged item is set to *N*.	Changes were made to the *cl_myAccount.xsl* file.		OPAC	16384-7713
16384-19286	16384-7889	If results from a CALL search are sorted by Publication Date or Publication Date Descending, call numbers from records with multiple holdings display as null.	Results from a call number search retain the call number when resorted by Publication Date or Publication Date Descending and the page retains the Sort By menu.			OPAC	16384-7889
16384-19345	16384-7921	Text of comments and bib info in a notification e-mail is missing the line feed characters and putting all text on one line.	Modified the code to retain the line feed in the comment and bib info fields on bib-level request forms when the e-mail notification is created.			OPAC	16384-7921
16384-19973	16384-8162	When the 1040 display code shows information from 853/863 pairs (in the MFHD) and volumes are entered with an open-ended hyphen, everything is displayed except for the hyphen.	In 853/863 pairs, volumes entered with an open-ended hyphen keep the hyphen in the display.	Changes were made to the *104x_display.xml* file.		OPAC	16384-8162
16384-21510	16384-8801	If the final twelfth character is entered as a lowercase letter, it is stored as such and patrons cannot login to WebVoyáge.	All characters of the patron PIN are normalized in the same manner.			Circulation	16384-8801

KB Number	Issue Number	Description	Solution	Implementation Notes	Related Documentation	Module	Issue Number
16384-21513	16384-8834	There is no Reset button on the Basic, Advanced, Subject and Author search pages.	Added a Reset button on the Basic, Advanced, Subject and Author search pages. See companion fix 16384-14082.			OPAC	16384-8834
16384-22980	16384-9395	The order specified for the quick limits in WebVoyáge in *webvoyage.properties* is used for the Limits drop-down list on the Basic search page, but the list shown on the results list pages has no sort order.	This was found to be working correctly in 7.2.5.			OPAC	16384-9395
16384-23458	16384-9441	When attempting to print all of the records in a results list of a SUBJ search or browse (headings title list), the OPAC renders most, but not all of the records in the list.	On a titles list that results from a headings search, if the user elects to perform an action (such as printing for instance) on *All* the records, the entire result set is selected for that action.			OPAC	16384-9441
